

| repo_name                       | system_summary                                                                                                                                                                                                                                               | initial_notes_thread_model_workload                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | Remote desktop application (screen sharing, input forwarding, networking, multimedia streaming)                                                                                                                                                              | Real-time video/audio streaming (CPU + IO), continuous networking, and UI/input handling. Likely uses async networking + dedicated threads for encoding/decoding and system interaction.                                                                                                                                                                        |
| rustdesk/rustdesk               |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                 |
| dani-garcia/vaultwarden         | Self-hosted Bitwarden backend server (HTTP API + DB + authentication)                                                                                                                                                                                        | Web server architecture, HTTP + DB interactions dominate --> typical Rust servers use async runtimes (Rocket/Tokio). Minimal CPU-heavy work beyond serialisation and crypto.                                                                                                                                                                                    |
|                                 | Android systemless rooting and module management                                                                                                                                                                                                             | CPU: boot image patching, script/module execution, system modification logic, IO: filesystem operations, mounting partitions, interacting with Android system interfaces -> hybrid. Staged architecture (install -> patch -> mount etc) -> suggests pipeline. Dedicated worker threads can be used to isolate system-level operations from UI/CLI interactions. |
| topjohnwu/Magisk                | framework                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | GPU-accelerated terminal emulator                                                                                                                                                                                                                            | IO: keyboard input, terminal I/O, CPU: glyph rasterization, command submission, frame updates -> hybrid. Event-loop: for input/event dispatch and OS integration, Dedicated worker threads: isolate rendering and heavy computation from event handling                                                                                                         |
| alacritty/alacritty             |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | Text editor with LSP integration and terminal UI                                                                                                                                                                                                             | IO: LSP, file reading/writing, terminal input/output, CPU: syntax highlighting, parsing, incremental updates -> hybrid. Event loop: UI/input handling, Message-driven: coordinate editor, LSP clients, and rendering subsystems                                                                                                                                 |
| helix-editor/helix              |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | CLI tool for switching and managing Cargo compiler configurations                                                                                                                                                                                            | Filesystem interaction, configuration management, subprocess execution. Likely coordination-heavy. Shared state probably used for configuration/session management while async tasks handle CLI and external tool interactions.                                                                                                                                 |
| farion1231/cc-switch            |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | Parallel file-search, alternative to find                                                                                                                                                                                                                    | Filesystem traversal and metadata access are I/O-heavy, recursive directory scanning, regex matching, and filtering are CPU/heavy. Rust search tools commonly use rayon-style thread pools for scalable parallel traversal                                                                                                                                      |
| sharkdp/fd                      |                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | Shell and scripting environment with pipelines and plugin execution                                                                                                                                                                                          | Shell execution: I/O, pipelines, interactive terminal coordination, parsing, and plugin execution. Likely uses async runtime for command orchestration and coordination between pipeline stages and plugins.                                                                                                                                                    |
